FELLOWSHIP OF CHURCHES IN CENTRAL FLORIDA

For the purpose of edifying our central Florida churches and working on Florida evangelism, we have organized fellowships to encourage love and evangelism in our respective places in Florida. To do this, every three (3) months we meet in different places in Central Florida. This time we met in West Palm Beach. 150 people attended this event with songs and two messages from the word of God followed by a meal for all those present. Glory to God for his work that advances at a firm pace.

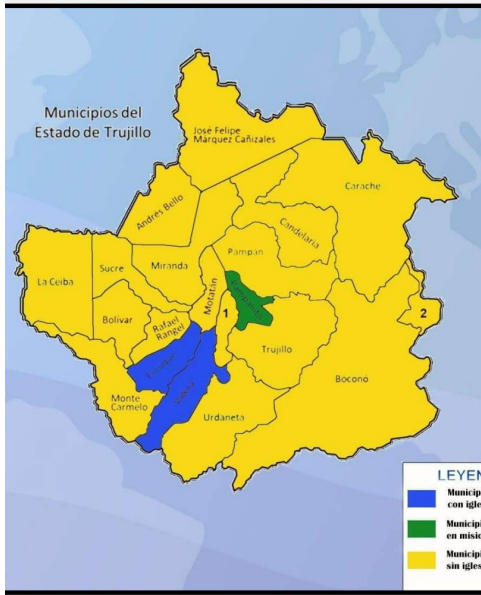

PRAY FOR OUR MISSION IN FLORIDA

When Maritza and I arrived in Central Florida, there was no Hispanic ministry in and around Tampa. After the Pandemic, two important points have been achieved, for the glory of God, to reach the Hispanic population in these places. In the graph you can notice the red dots where we already have a ministry and the green dots with the potential to have them very soon. Please pray for this vision that God will do His work through us, and that we can train workers to continue this work.

MISSION OVERSEAS

Trujillo-Venezuela

As in Florida, I am advising an evangelistic team in Trujillo, Venezuela to use a biblical-missionary strategy that allows them to reach the entire state. Please pray for this advancement of the kingdom of God in Venezuela. The color Blue indicates places already reached, and green indicates that they are in the process of establishing a church growth group there.

Gladys Briceño from Pampanito, Venezuela

New Group in Pampanito

A SHORT-TAILED HAWK IN MY YARD

This bird was in my backyard few days ago

Native to South America, this bird is **only found in Florida** in the United States where its both breeding and wintering. The bird is very dark brown all over the upperparts with a pale underside. It is a **secretive bird** and thus not a lot is known about its way of life.

A domesticated Short-Tailed Hawk sitting on a glove during a falconer show. The breeding behavior of the Short-Tailed Hawk is not well known, but it is thought that this bird behaves the same as other hawks when it comes to the male's aerial displays for the female. The nest site is usually in tall pine or cypress trees and is very bulky.

The hawk is known to use the technique called **kiting**, where they will soar high above ground using the headwind to stand still in the air while scouting for prey below. In Florida they're mostly known to eat small birds.

Not a lot is known about the species, and no population surveys have been made, but it is thought to be an uncommon species. Due to its large range they're considered by IUCN to be of least concern.

Only around 500 individuals are believed to reside in the central parts of peninsular Florida. The best time to spot them is in the Florida Keys and Everglades National Park during fall migration, where they will soar high above the ground in the morning.

PLEASE PRAY FOR

Our health, ministry, Everett Stringfellow (health) and Maritza Pineda (health). The visions for Central Florida and overseas.
